

FOREWORD

Géza Bognár; professor emeritus; Dennis Gabor College

The management and the staff DGC are deeply convinced of the necessity for application-level scientific research. What is exactly application-level research? The concept covers research projects whose results can be put to practical use directly, and preferably immediately.

These research projects are influencing our day-to-day teaching activities, and some results are immediately included in our syllabi. It should be noted that, due to the globalization of scientific research, DGC is obliged to follow this path and must manage its research projects in international clusters.

However, we highly appreciate the research projects of our staff members, which are carried out at the national level. These latter research projects are mostly the PhD dissertations of our young colleagues, who are at the beginning of their scientific carrier.

The above principles should be represented in the editing of our scientific journal INFORMATIKA. That is why young researchers at our partner

universities may publish their latest issues in our journal, and that is why our international approach is reflected in the composition of our Editorial Body and Reviewers List.

The external conditions of DGC's operation are ever changing. The latest developments are relatively preferable, so the enrolment of new students for the academic year 2020/21 is ensured. Nevertheless, we must continue with our efforts for a higher recognition of private schools in the future.

It is extremely important to secure external resources for our continued scientific and teaching activity. The successful identification and involvement of external resources is the key to the future development of our school.

I wish that our readers share the joy and excitement we felt while editing this latest issue of INFORMATIKA.

Budapest, the 18th November 2019.
